Battery cabinet determines how much current

Overview

The type of chemical reaction taking place inside the battery will determine how much current it can produce. In many devices that use batteries -- such as portable radios and flashlights -- you don't use just one cell at a time. You normally group them. When determining the capacity of an energy storage cabinet, one must consider several key factors that contribute to its overall efficiency and functionality. Understand your energy needs, which involves assessing how much power will be required for your specific applications, both in daily. Voltage is the electrical pressure that pushes electrons, determining how much power the battery can deliver—higher voltage means more potential energy. Capacity indicates how long the battery can run before. Does the battery determine the amount of current flow in the circuit?

yes and no For the most part no, and this would be because most times a given circuit is deigned or wired properly as well as the battery being sized properly for the given power requirements. 271A on the nameplate on what piece of equipment?

Seems odd for a cabinet with two 400A breakers.
