Can pumpkins be grown under photovoltaic panels

Overview

These crops are commonly grown underneath solar infrastructure and for good reason - they thrive! Although these are recommendations, they should not be viewed as limitations. Agrivoltaic farming is the practice of using land for both agriculture and solar energy production. It works by placing solar panels high above crops. The solar panels protect crops from extreme weather conditions, extending growing seasons and improving crop quality. Proponents say the technology can help achieve clean energy goals while maintaining food production, but experts caution that careful analysis and guidelines are needed if we're not to compromise agricultural production. It allows for renewable energy systems and agriculture to occur on the same piece of land.
