Does every photovoltaic panel need to have a water tank

Overview

Most solar water heaters require a well-insulated storage tank. Solar storage tanks have an additional outlet and inlet connected to and from the collector. They can be used in any climate, and the fuel they use—sunshine—is free. Not only do these systems significantly reduce utility costs—by as much as 80%—but they also foster energy. When constructing a home to be renewable energy ready, the solar hot water storage tank is one of two major components of a solar water heating system that are installed in the utility room. Think of it like adding a turbocharger to your electric vehicle - same basic concept, but suddenly you're getting way more bang for your buck. Let's. The design and construction of any water system (regardless of the system's source of power) must be performed in full compliance with all codes, standards, and regulations of those governing entities that have enforceable jurisdiction over the location at which the water system will be installed.
