Generator set parallel automatic power station

Overview

Pairing multiple generators, also known as generator paralleling, offers a flexible and efficient solution to meet varying power needs. This guide will walk you through the process, benefits, and considerations of using multiple generators in parallel. A process that once required discrete synchronizing components, panels full of induction disc protective relays and analog meters is now being performed with fewer and more cost-effective microprocessor-based componentry. Either to supply electrical power to a facility in island mode spitals or data centres in the event of a failure from the Utility. In other situations they are used for periodic emergency support to directly back-up the national. The art of paralleling generator sets has evolved over time. MPS is a transformational technology that eliminates the expense and space requirements required with traditional paralleling solutions. In the past, you had to purchase pricey third-party switchgear.
