How to solve the problem of wind turbine without wind

Overview

But a new approach from researchers at MIT could mitigate that problem, allowing the electricity generated by floating wind farms to be stored and then used, on demand, whenever it's needed. The key to this concept is the placement of huge concrete spheres on the seafloor under. Once a turbine is going, it can take hours to slow back down, and that could explain why they are turning without wind. They could also be drawing power from the grid to rotate the blades during cold periods of the year to prevent the blades and gears freezing up. During this time, they are still. Bladeless wind turbines are an innovative, efficient and less invasive solution. Energy storage using compressed air ensures a stable power supply. The UK's National Energy.
