Inter seasonal thermal storage

Overview

Seasonal thermal energy storage (STES), also known as inter-seasonal thermal energy storage, [1] is the storage of heat or cold for periods of up to several months. The thermal energy can be collected whenever it is available and be used whenever needed, such as in the opposing season. It is proposed that the summer heat can be injected into the ground. A significant amount of energy can be saved by storing excess heat during the warmer months, and using it to warm up a building in winter. © Erik Christensen - Wikimedia commons - In Marstal (Denmark), solar thermal panels heat water stored in a large pit before the heat is re-used in homes. Inter-Seasonal Heat Storage

It employs two isothermal storage tanks[3], one operating at zero degrees (water) and the other at 42 degrees (selected paraffin wax). The water freezes at night and then the ice melts during the day.

What is inter-seasonal heat storage? - The Earthbound Report

They collect heat using thermal hot water systems on garage roofs, and pipe the surplus into 37 metre deep boreholes in the rock. The system is able to meet 97% of the community's heating needs in this ...

Seasonal thermal energy storage: A techno-economic literature review

Seasonal thermal energy storage (STES) holds great promise for storing summer heat for winter use. It allows renewable resources to meet the seasonal heat demand without resorting to fossil-based back ...
