## Overview

---

Scientific consensus indicates that EMF from a properly installed solar system poses no measurable health risk to occupants. Concerns often center on potential health impacts from electrical operation, the materials used in the panels, and physical hazards related to installation or malfunction. EMF stands for manmade “electromagnetic field (s)”, such as produce unnatural electric, magnetic, or rf (microwave). Results consistently show that site contamination risks are exceptionally low, lower than for most other industrial uses. Solar panels use few hazardous materials to begin with. When used, these materials come in very small quantities, and they are sealed in high-strength encapsulants that prevent. Photovoltaic (PV) technologies and solar inverters are not known to pose any significant health dangers to their neighbors. For example, in addition to the harmful.
