Overview

- Maximum voltage: 115V Step-3. Calculate maximum panels in series: - The MPPT requires an input between 60V - 115V - Each solar panel has a V_{oc} of 49V - So the maximum panels in series is: $115V (max)/49V = 2.3$ panels (round down to 2 panels to stay under max voltage). Configuring the right number of panels in series and parallel is essential to take full advantage of your MPPT. Staying within this range means you'll get the highest throughput and efficiency. Determining the optimal solar array. Wiring solar panels in series means connecting the positive terminal of one panel to the negative terminal of the next, which increases the system's voltage while maintaining the same current. But many times, we need power in a range from kW to MW. A String of PV Modules When N-number of PV modules are connected in series. System designers regularly performed this calculation before the advent of dc optimizers.
