# Minimum load bearing capacity of battery cabinet in computer room

## Overview

---

ASCE 7-22, Minimum Design Loads and Associated Criteria for Buildings and Other Structures, specifies a 100 psf distributed load or 2,000-pound point load for “Computer use – Access floor systems. ”. NFPA 70E ®, Standard for Electrical Safety in the Workplace®, Chapter 3 covers special electrical equipment in the workplace and modifies the general requirements of Chapter 1. The chapter covers the additional safety-related work practices necessary to practically safeguard employees against the. The cabinets typically used in data centers can support 2,500 to 3,000 pounds (approximately 1,134 to 1,361 kilograms) of hardware. Therefore, the floor must be sturdy enough to support this weight. Depending on the number of devices, the floor of a data center might need to support a weight. This course describes the hazards associated with batteries and highlights those safety features that must be taken into consideration when designing, constructing and fitting out a battery room. Local Authorities Having Jurisdictions often have varying requirements based on areas they serve. This article covers key design considerations and relevant standards.
