**New energy must be equipped
with energy storage projects**

Overview

Energy storage systems are technologies that store excess energy for later use, ensuring a reliable and stable supply of electricity when demand peaks. This amount represents an almost 30% increase from 2024 when 48.6 GW of capacity was installed, the largest. Developments will address grid reliability, long duration energy storage, and storage manufacturing. The Department of Energy's (DOE) Office of Electricity (OE) is pioneering innovations to advance a 21st century electric grid. Commercial systems stack demand charge reduction, backup power value, and grid services participation. This multi-revenue approach significantly improves project economics. This "feast-or-famine" energy production is exactly why new energy must be equipped with energy storage.
