Overview

This paper investigates the construction and operation of a residential photovoltaic energy storage system in the context of the current step-peak-valley tariff system. Firstly, an introduction to the structure of the photovoltaic-energy storage system and the associated tariff system will be. With the integration of large-scale renewable energy generation, some new problems and challenges are brought for the operation and planning of power systems with the aim of mitigating the adverse effects of integrating photovoltaic plants into the grid and safeguarding the interests of diverse. Governments worldwide now mandate minimum energy storage ratios for grid-connected solar projects. California's Title 24, for instance, requires 30% storage capacity for new commercial installations—like requiring coffee shops to stock triple-shot espresso as standard. As global utility-scale solar + storage capacity is expected to reach 250 GW by 2034 (up from 100 GW in 2022), one challenge persists: intermittency.
