Overview

On flat roofs, the best option is to install solar panels at an incline, with structures that allow the inclination of the solar panels to be regulated, as they can be fixed directly to the surface and the photovoltaic modules maximise their performance with a small. On flat roofs, the best option is to install solar panels at an incline, with structures that allow the inclination of the solar panels to be regulated, as they can be fixed directly to the surface and the photovoltaic modules maximise their performance with a small.

Example: In Marseille, for conventional thermal energy, 4m² of panels are necessary for a typical home's hot water needs (200 L at 45 ° C) and the best inclination of the panels is between 50° and 55°. This inclination does not correspond to maximum sunshine, but because there is a surplus of. When installing a photovoltaic system, the choice of panel tilt is a key aspect in optimizing energy production. A correctly tilted system can improve efficiency by 5-10% annually, reducing payback time and boosting long-term savings. The direction is more important than the angle.
