Overview

The article provides an overview of photovoltaic (PV) cell, explaining their working principles, types, materials, and applications. Photovoltaic (PV). Solar Cell Definition: A solar cell (also known as a photovoltaic cell) is an electrical device that transforms light energy directly into electrical energy using the photovoltaic effect. Working Principle: The working of solar cells involves light photons creating electron-hole pairs at the p-n. When light shines on a photovoltaic (PV) cell - also called a solar cell - that light may be reflected, absorbed, or pass right through the cell. The PV cell is composed of semiconductor material; the "semi" means that it can conduct electricity better than an insulator but not as well as a good. A PV Cell or Solar Cell or Photovoltaic Cell is the smallest and basic building block of a Photovoltaic System (Solar Module and a Solar Panel). These cells vary in size ranging from about 0. PV cells are made of materials that produce excited electrons when exposed to light.
