Purpose of the grid-connected grounding network for solar container communication station inverters

Overview

Utility requirements for effective grounding play a key role in mitigating potential temporary overvoltages that may arise from PV inverters. When a line-to-ground fault occurs in a three-phase grid distribution system, substation equipment typically detects it and opens. The concept and purpose of grounding in DC systems, such as solar panels and photovoltaic arrays, are the same as in AC systems. A slight transition resistance from the ground electrode to ground is crucial in all. An SMA product (PV, hybrid, battery or Sunny Island inverter) is part of a PV system in which each component, if connected incorrectly, can affect the system in an undesirable way.
