# Series connection between photovoltaic panels

## Overview

---

Solar panels wired in series are connected in a single string, with each panel's positive terminal linked to the next panel's negative terminal. This setup increases the system's total voltage while keeping the current the same. Voltage Calculation is Critical for Safety: Series wiring adds voltages together, and temperature variations can push systems beyond safe limits. Always calculate maximum cold-weather voltage using temperature coefficients to ensure you stay within NEC's 600V limit for residential installations and. Series connections are ideal for larger home solar systems (4kW+) and long distances to the inverter, but they're vulnerable to shading issues since one shaded panel affects the entire string. Parallel connections is optimal for smaller setups like RV and boat systems, offering excellent shade. When it comes to solar panel series vs parallel connections, installers face a choice similar to Volta's: maximize voltage or current?

This decision can significantly impact your solar array's performance and efficiency. Understanding the differences between these two methods is essential for designing an efficient solar power system tailored to your energy needs.
