

## PEES Power Systems

**Solar power generation uses a slightly larger inverter**

## Overview

---

Proper inverter sizing is vital for ensuring optimal system performance, efficiency, and longevity. An undersized inverter can lead to clipping losses, where the excess DC power generated by the solar panels is wasted due to the inverter's inability to handle the full. In building a first off-grid or hybrid solar system, one of the most common mistakes is choosing an inverter that is far larger than the actual battery and PV array can support. A typical beginner setup might look like this: a 10 kW inverter, a 5 kWh battery, and only 2 kW of solar panels. The decision to oversize or undersize your inverter relative to your PV array can have a significant impact on your daily energy. Your solar inverter serves as the translator between your panels and your home's electrical system. Solar panels generate direct current (DC) electricity, but your home runs on alternating current (AC).

### Lesson 5: Solar inverter oversizing vs. undersizing

Solar Inverter Undersizing Causes Clipping  
When Oversizing An Inverter Is A Good Choice  
Why Undersizing An Inverter Can Be A Good Choice  
How Much Should You Undersize An Inverter?  
How The DC-to-AC Ratio Affects Total System Output  
Conclusion: Undersizing An Inverter Has Become A Best Practice  
According to the Clean Energy

Council, you can have a solar array that can put out up to 30% more power than the inverter is rated for and remain within safe guidelines. The amount that you would want to undersize the inverter depends on the conditions that the system is installed in. Primarily, the DC-to-AC ratio, which is the ratio of DC current See more on freedomforever
