Where can photovoltaic panels be built and used

Overview

PV can be the solution—for rural homes, villages in developing nations, lighthouses, offshore oil platforms, desalination plants, and remote health clinics. Many acres of PV panels can provide utility-scale power—from tens of megawatts to more than a gigawatt of electricity. These large systems, using fixed or sun-tracking panels, feed power into municipal or regional grids. It is not always cost-effective, convenient, or even possible to extend power. A solar photovoltaic (PV) power plant is an innovative energy solution that converts sunlight into electricity using the photovoltaic effect. This process occurs when photons from sunlight strike a material, typically silicon, and displace electrons, generating a direct current (DC). As the United States works toward decarbonizing the electricity system by 2035, solar capacity will need to reach one terawatt (TW), which will. The International Energy Agency (IEA) estimates that 450 gigawatts (GW) of new green power will be installed worldwide by the end of 2023, two-thirds of which will be photovoltaic (PV) systems.
