Wind power generation disturbs residents

CE UN38.3 

Overview

While research on the health effects of wind turbine noise is ongoing, some studies suggest that low-frequency noise from wind turbines can affect heart rate variability and cause annoyance to residents. Wind energy provides a low-carbon alternative to fossil fuels but raises concerns about noise and its impact on local communities. To better understand the actual impact of wind turbine noise, an interactive app was utilized across several wind projects, allowing residents to easily report their real-time experiences with turbine noise. One such. As a sustainable and renewable source of electricity with a robust supply chain, wind power is one of the planet's fastest-growing energy sources. But it may not be growing fast enough. To reach Net Zero by 2050, The International Energy Agency (IEA) says the rate of growth needs to increase to 17%. Wind energy has been hailed as one of the keystones of sustainable development, promising a reduced carbon footprint and a greener environment.
